

Ideas for Implementation:

Helpful Click Decorators & Utilities

- click's `--help` option will be ideal for users
- `click.option()`: this will be very useful for flags that may be used
 - will be able to use commands like `is_flag`, `flag_value`, `count`, `help`, etc.
- `click.group()`: this will allow FRE to be broken up into parts and subparts for each part
 - will be able to use commands like `add_command`
- `click.progressbar()`: potential for the user to see progress while something runs like `fre run`
- `click.confirm()`: potential for the user to verify actions and proceed
- `click.style()`: can style text with wanted configurations if needed (can use `click.secho()`)
- `click.pause()`: stops executing current command and waits for user input to continue

Potential Errors

- environments: I'm working with mainly `venv` right now, but `conda` and `venv` on other computers may fail
 - this is likely due to the setup, within `setup.py` and calling `pip install --editable` after
